

JOSKIN offers now hydraulic, adjustable and practical extensions for the Trans-SPACE 7000/125 and 8000/150 agricultural trailers. They make the loading operations easier and allow the total transport volume to be increased. The extra DIN volume is of 8.4 m³ on 7000/125 and 9.4 m³ on 8000/150.

The loading height of the trailer can be adapted for the potato and sugar beet harvests. The falling height can be significantly reduced by lowering the extensions in order to avoid damages to the products.

Thanks to the great flexibility and easy and fast setting of those extensions, the loading process is much more easier. Moreover, this also avoids any damages to the sides of the trailer body.

Those extensions are made of steel and can either be operated by a electro-hydraulic function or with a direct connection to the tractor.

It is possible to add a cover by means of telescopic brackets fitted on the extensions, so that it can follow the movement up and down.

The explainer video is available on <https://www.youtube.com/user/JoskinSA>.

Non contractual data, likely to change.

Advantages:

- lower loading height,
- extra volume,
- management of the side height,
- compatible with alu extension,
- protection of the matter and tipping trailer against shocks.
