

SCARIFLEX MAX R6D2S3:

A versatile solution combining grass harrow and regenerator according to the needs

The priority of the Belgian company JOSKIN is first of all to adapt its products to the farmers' needs. That is why the world's leading manufacturer of manure spreading machines and agricultural trailers offers a new aerator model combining two functions in one machine.

Principle:

The new SCARIFLEX MAX is fitted with 7 rows of 3 different tools, the **working depth of which** can be **individually adjusted** according to the tasks to carry out. To regenerate the meadow, it is fitted with more aggressive tines working more deeply. Furthermore, the independent adjustments allow to lift **the unnecessary tools**.

Functions:

1. Levelling, harrowing dungs:

- A row of hard scrapers on springs allow to level molehills and manure heaps, and to **flatten** and level the ground.
- The second row is fitted with levelling scrapers on half-flexible leaves that harrow dungs and spread molehills and manure heaps.
- Harrowing dungs will allow to spread their fertilizing elements and avoid grass leftovers.

It also leads to a reduction of the chances of survival of parasites during the winter.

SCARIFLEX MAX R6D2S3:

A versatile solution combining grass harrow and regenerator according to the needs

2. Regeneration:

- 2 rows of spring tines (the same as on the RENOVA) will work aggressively by scarifying in order to make the plant grow faster and to improve the productivity of the meadow.
- This step allows to **regenerate** and **aerate** the meadow soils after winter.

3. Working the surface:

 3 rows of flexible tines at the back will as on the SCARIFLEX - efficiently remove the possible moss from the ground.

They will scratch the grass surface: perfect for the regular grass care.

This essential tool will accompany you through the seasons: before and after the winter to **regenerate** the meadows and throughout the entire year to **aerate** and maintain the meadow.

Spring tines

Easy adjustment
